davide.neri@di.unipi.it

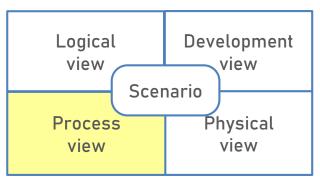

How to check whether one or more microservices design **principles** are **violated** in an application?

Which refactorings can be applied to resolve violations of the principles?

Goal

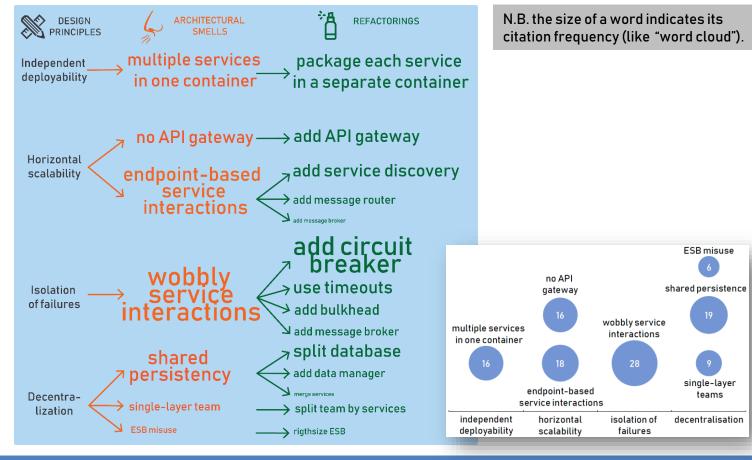

4+1 viewpoint

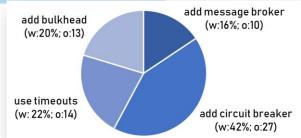

Result: Taxonomy for microservices

Example: Isolation of failures

A microservice should be designed so that it tolerates the failure of any invocation to the microservices it depends on.

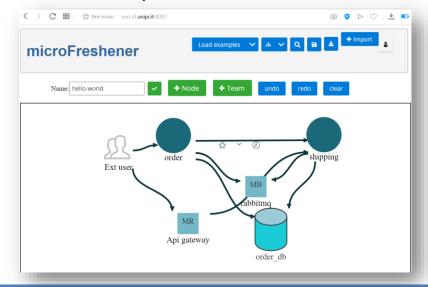

Conclusions

- multivocal review proposing a taxonomy for microservices (4 design principles of microservices, 7 architectural smells and 16 refactorings)
- taxonomy can help researchers and practitioners to design microservices

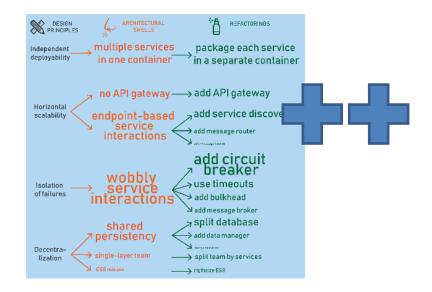

Future work

Design time support for microservices

Tool for automatically detect architectural smells and propose refactoring in microservices.
[submitted for publication]

Extend taxonomy (add design principle, add refactorings smells,...)

Thank you
